

- The male camlock fitting can be used to fill the water holding tank and will also be the drain pipe when you want to drain the tank. Having the pipe diverted out of the trailer will give you the capability to drain water with all of the trailer doors closed, as well as prevent water spilling on the trailer floor when disconnecting the water fill hose.

Draining the water and then leaving the valves open while you drive will help get all of the water out of the tanks and pipes, which is helpful in cold months when you will be winterizing the machine. You do not want any water sitting in the tank or pipes if it will freeze.

- Ball valves will give you control over where the water is flowing.
